

(UNIVERSITY OF CHOICE)

**MASINDE MULIRO UNIVERSITY OF SCIENCE AND
TECHNOLOGY**

(MMUST)

MAIN

UNIVERSITY EXAMINATIONS

2021/2022 ACADEMIC YEAR

FIRST YEAR SECOND SEMESTER EXAMINATIONS

MAIN EXAM

**FOR THE MASTER OF EDUCATION DEGREE
(SPECIAL NEEDS EDUCATION)**

COURSE CODE: MSE 802

COURSE TITLE: EDUCATIONAL STATISTICS

DATE: 27/04/2022

TIME: 2:00 – 5:00 PM

INSTRUCTIONS TO CANDIDATES

Answer ANY FOUR questions only

TIME: 3 Hours

MMUST observes ZERO tolerance to examination cheating

1) A medical researcher conjectures that smoking can result in the wrinkled skin around the eyes. The researcher recruited **150 smokers** and **250 nonsmokers** to take part in an observational study and found that **95** of the **smokers** and **105** of the **nonsmokers** were seen to have prominent wrinkles around the eyes (based on a standardized wrinkle score administered by a person who did not know if the subject smoked or not). **How do the smokers compare to the non-smokers?** (15mks)

2) The table below provides scores for ten students in mathematics and English. Calculate a Spearman rank-order correlation on the data. At $\alpha=0.5$ test whether the correlation is significant. (15mks)

	Marks									
English	56	75	45	71	62	64	58	80	76	61
Maths	66	70	40	60	65	56	59	77	67	63

3.) In an intelligence test administered to 100 children, the mean of the test was 100 and standard deviation 20.

- Find the number of children exceeding a score of 125. (5mks)
- Suppose 5% of the lower end of the distribution is to be selected for an enrichment program, what should be the cut off mark? (10mks)

4. A research study was conducted to examine the differences between older and younger adults on perceived life satisfaction. A pilot study was conducted to examine this hypothesis. Ten older adults (over the age of 70) and ten younger adults (between 20 and 30) were give a life satisfaction test. Scores on the measure ranged from 0 to 60 with high scores indicative of high life satisfaction; low scores indicative of low life satisfaction. The data are presented below. Compute the appropriate t-test.

Old Adults	Young Adults
45	34
38	22
52	15
48	27
25	37
39	41
51	24
46	19
55	26
46	36

- What is your computed answer? (3mks)
- What would be the null and alternative hypothesis in this study?(3mks)
- What probability level did you choose and why?(3mks)
- What is your t_{crit} ?(3mks)
- Is there a significant difference between the two groups?(3mks)

THE CRITICAL TABLES

Statistical Table 1.3 Critical values of t (t is significant when it equals or exceeds the table value)

df	level of significance for a one-tailed test													
	.10	.05	.01				.005				.0005			
	.025					.01					.002			
level of significance for a two-tailed test

2000	1.28	1.65	1.96	2.33	2.58	3.09	3.30							

Source: The entries in this table were computed by Pat Dugard, a freelance statistician. For an independent groups (between Ss) test, $df=N-2$ (where N is the total number of scores in both groups) For a related (within Ss or matched pairs) test, $df=N-1$ (where N is the number of pairs of scores)

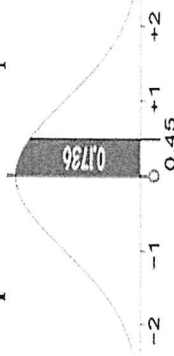

Table 1.4: Standard normal curve area table

The areas under the standard normal curve corresponding to distances on the baseline between the mean and each z

The table shows the area from 0 to Z. Instead of one LONG table, we have put the "0.1"s running down, then the "0.01"s running along. (Example of how to use is below)

Example: Percent of Population between 0 and 0.45

Start at the row for 0.4, and read along until 0.45; there is the value 0.1736
 And 0.1736 is **17.36%**. So 17.36% of the population is between 0 and 0.45 Standard Deviations from the Mean.

Adapted from Appendix 2 (Critical Values of t) using the square root of $[t^2/(t^2 + df)]$ Note: Critical values for Infinite df actually calculated for $df= 500$.
