

**FOURTH YEAR SECOND SEMESTER EXAMINATIONS
FOR
BACHELOR OF SCIENCE IN CIVIL AND STRUCTURAL ENGINEERING**

COURSE CODE: CSE 454
COURSE NAME: IRRIGATION ENGINEERING I

Instructions to candidates

- This paper consists of **FIVE (5)** questions
 - Answer **Question ONE** any other **THREE (3)** questions
 - All symbols have their usual meanings unless otherwise stated
 - Ensure you have **THREE (3)** Cartesian graph paper
 - Time allowed is **THREE (3)** hours
-

Question ONE Compulsory (40 marks)

- a) Differentiate between infiltration and percolation (2 marks)
- b) Briefly explain the following terms used in irrigation
- i. Available moisture
 - ii. Crop water requirement
 - iii. Irrigation water requirements (6 marks)
- c) A client needs to invest in irrigated agriculture on a farm bought recently in semi-arid area.
- i. Discuss the advantages and disadvantages of possible system that you may advice the client to try (5 marks)
 - ii. State the various components of a typical system suggested in for the client in (i) above (4 marks)
- d) Briefly discuss the advantages and disadvantages of irrigated agriculture (8 marks)
- e) Two experiments were undertaken to determine the infiltration rate of a soil and length of furrow to keep deep percolation minimal. A test furrow of wetted perimeter of 0.75m and length 30m was used to determine infiltration rates and data in Table 1 was obtained

Table 1

Average contact time (mins)	Furrow inflow (l/s)	Furrow outflow (l/s)
8	0.84	0.12
11	0.84	0.36
14	0.84	0.42
19	0.84	0.50
29	0.84	0.55

In furrow length test the data obtained is given in Table 2

Table 2

Distance of furrow (m)	Advance time (mins)
0	0.0
10	0.3
20	0.7
30	1.2
40	2.0
50	3.8
60	6.0

Given that the desired depth of irrigation is 180 mm, estimate appropriate furrow length
(15 marks)

Question TWO (20 marks)

- a) Consider a crop with a rooting depth of 0.6m grown in a field with the following data:
B.d = 1.25 g/cm³, FC = 16%, PWP = 8%, MAD = 60% of TAWC.
Compute the Design Net Water Requirement (DeNWR) (4 marks)
- b) Briefly explain the following terms used in furrow irrigation system
- Intake opportunity time
 - Advance stream
 - Cut back stream
 - Quarter time rule (6 marks)
- c) Briefly explain the main factors that need to be considered when selecting an appropriate surface irrigation system (10 marks)

Question THREE (20 marks)

- a) Explain the factors that govern design of border irrigation system (6 marks)
- b) The selection of an irrigation system/method depends on two factors: Technical feasibility and Economics. Discuss (14 marks)

Question FOUR (20 marks)

- a) Briefly explain the following:
- Five (5) causes of water logging (5 marks)
 - Three (3) preventive measures of water logging (3 marks)
 - Two (2) curative measures of water logging (2 marks)
- b) A cotton crop is to be grown in an area designated for sprinkler system. The following data is available: DRZ = 0.8m, ET_c = 6mm/day, MAD = 70%, FC = 28%, PWP = 16%, B.d = 1.2g/cm³. A period of 2 days is required for various farm operations and the system efficiency is 85%. If the water is sprinkled at a rate of 8 mm/hr, computed
- Net water requirement (NWR) (2 marks)
 - Gross water requirement(GWR) (2 marks)
 - Irrigation interval (II) (2 marks)
 - Design interval (2 marks)
 - Duration of water application (2 marks)

Question FIVE (20 marks)

- a) An orchard is to be irrigated using drip irrigation system whose water application efficiency is about 80 percent. The trees are spaced at 3m x 6m and irrigated for 12 hours per day. If the conventional evapotranspiration rate is 7.6 mm/day and 75 percent of the area is shaded by trees in the orchard. Determine the following:
- Drip irrigation design ET rate
 - Required discharge per tree (l/s)
 - Discharge of each emitter, if four emitters are used per tree
 - Average operating pressure head, if a medium long path emitter is used.
- Assume the emitter constant is 7.3×10^{-5} and emitter discharge exponent, x is 0.63
(8 marks)

- b) The following data were collected from a double ring infiltrometer. The cross section area of the inner ring was 500cm^2 . Determine the infiltration rate equation $\mathbf{I} = \mathbf{at}^{\mathbf{n}}$, where \mathbf{I} is infiltration rate (cm/min), \mathbf{t} is intake opportunity time (min) and \mathbf{a} and \mathbf{n} are constants (12 marks)

<i>Time (minutes)</i>	<i>Cumulative infiltration (cm³)</i>
0	0
2	270
4	450
6	620
8	770
10	900
20	1420
40	2410
